Most people who try AI at work start with a blank box and a vague question. The answer comes back vague too. A good prompt fixes that: it gives the AI a role, a task, the context and the shape of the answer you want.

Writing that prompt takes time you do not have on a Tuesday afternoon. So we collected the ones that work and put them in one place.

What is in the library

The prompts are sorted in seven categories:

- **Images:** illustrations, icons, product shots and visual styles.
- **Writing:** articles, summaries, analyses and plans.
- **Agents:** instructions that set up an AI assistant for a role.
- **Process:** process analysis and BPMN, plus the automation potential of a process.
- **Video:** scripts and prompts for video models.
- **Tips and fixes:** short prompts that improve the answer you already have.
- **Code:** prompts for coding assistants.

Each prompt has a short description of what it produces. Image prompts show an example of the result. Many prompts come from our own field work and from experts we work with. When a prompt has a known source, the page names it. We add prompts as we find new ones that work.

How you use a prompt

Open a prompt and read it where it sits. Many prompts have blanks, such as your industry or your audience. You type each blank directly inside the text. The Copy button gives you the finished text. You paste it into the AI you already use: ChatGPT, Claude, Gemini or Copilot.

An entry can hold more than one prompt. It may be a sequence of steps, or three options to choose from. Each one has its own Copy button, so you take only the part you need.

Some prompts are long documents in Markdown, and some are JSON. You can read them formatted, or switch to the raw text that the AI receives.

English and French

Every prompt has a French version. We wrote the French for people who work in French, and we did not run the English through a translator. Image and video prompts keep their prompt text in English. Those models answer best to English. Their titles and instructions are in French.

Free, no account

The library is free. You do not need an account, and we do not ask for your email. Nothing is for sale. We built it to help people write clearer text for the machines they work with.

Why we built it

You can't automate what you don't understand. A prompt is the smallest unit of that understanding. It makes you say what the work is and who does it. It also makes you say what a good result looks like. A prompt library is a first step before an AI project, not a replacement for one.

When you are ready to go past single prompts, to an AI that works inside your process, talk to us.
